

What is a Good Research Problem?

- Well-defined: Would we be able to tell whether we've solved the problem?
- Highly important: Who would care about the solution to the problem? What would happen if we don't solve the problem?
- Solvable: Is there any clue about how to solve it? Do you have a baseline approach? Do you have the needed resources?
- Matching your strength: Are you at a good position to solve the problem?
