

# Computing Steps in Voice Response

---

Consider a voice-controlled smart home (or an online assistant).

Computing:

1. **get rid of noise**: other voices, music, television, video games, pets, and so forth.
2. **perform “voice recognition”**: translate an audio signal into a sequence of words.
3. **understand** what the human is trying to communicate: process their **natural language** (English, for example).
