

# Web Browser is a Client to a Web Server

---

A **web browser**

- is **client software**
- that enables a human
- **to** make use of **web servers**.

Last week, we talked about how a web browser communicates with a server.

The URL is what a human (or another web page) provides to identify which server to contact.

In a couple of weeks,

- we'll look at web search,
- another Internet service
- that allows one to find interesting URLs.
