

# Can't we Guarantee both?

- **Can be difficult to satisfy both liveness and safety in an asynchronous distributed system!**
  - Failure Detector: Completeness (Liveness) and Accuracy (Safety) cannot both be guaranteed by a failure detector in an asynchronous distributed system
  - Consensus: Decisions (Liveness) and correct decisions (Safety) cannot both be guaranteed by any consensus protocol in an asynchronous distributed system
  - Very difficult for legal systems (anywhere in the world) to guarantee that all criminals are jailed (Liveness) and no innocents are jailed (Safety)
