

Control Design Using Frequency Response

Bode's Gain-Phase Relationship suggests that we can shape the time response of the *closed-loop* system by choosing K (or, more generally, a dynamic controller $KD(s)$) to tune the Phase Margin.

In particular, from the quantitative Gain-Phase Relationship,

$$\text{Magnitude slope}(\omega_c) = -1 \quad \implies \quad \text{Phase}(\omega_c) \approx -90^\circ$$

— which gives us PM of 90° and consequently **good damping**.
