Controllability Matrix

Consider a single-input system $(u \in \mathbb{R})$:

$$\dot{x} = Ax + Bu, \qquad y = Cx \qquad \qquad x \in \mathbb{R}^n$$

The Controllability Matrix is defined as

$$C(A,B) = [B \mid AB \mid A^2B \mid \dots \mid A^{n-1}B]$$

We say that the above system is controllable if its controllability matrix C(A, B) is *invertible*.

- As we will see later, if the system is controllable, then we may assign arbitrary closed-loop poles by state feedback of the form u = -Kx.
- ▶ Whether or not the system is controllable depends on its state-space realization.
