

## Repeat and Count so Long as Words Match

Next, **compare the words**.

If words are the **same**,

- **add one to count** (2 with first match)
- and **read into buf2** again.

37

## Copy a Word When a Mismatch is Found?

**What if the words are different?**

**Copy buf2 into buf1**  
**and reset count to 1?**

That approach does work ...

38

## Use Double Buffering to Avoid Copying Strings

**Instead, let's use double buffering!**

**Create two pointers** to buffers.

**Initialize** as shown.

Instead of copying, **swap the pointers!**

39

## Double Buffering Has Many Applications

Example: **graphics**

- Write each frame a separate 'screen.'
- Swap 'screen' pointers to display.
- **Avoid flicker** due to writing to active display.

Example: **Linux serial driver**

- Interrupt handler reads input into a buffer.
- Swap buffer pointers when program reads data.
- **Avoid complex synchronization** for access.
