Pitfall: Marking Functions Virtual Only in Child Classes

The **virtual** qualifier **is inherited** implicitly,
- so **adding it** to **aFunc in ParentClass
  implies its use for all child classes**,
  such as **MyClass**.
- Add it to **MyClass** anyway for clarity.

The **virtual** qualifier is **not back-propagated
to parent classes**:
- if you only add it to **MyClass**,
- the call on the previous slide will
  STILL go to **ParentClass::aFunc**.
