## L14: Measurements of Energy

What happens when we measure the energy of a particle whose wave function is a superposition of more than one energy state?

If the wave function is in an energy eigenstate ( $E_1$ , say), then we know with certainty that we will obtain  $E_1$  (unless the apparatus is broken).

If the wave function is a superposition ( $\psi = a\psi_1 + b\psi_2$ ) of energies  $E_1$  and  $E_2$ , then we aren't certain what the result will be. However:

We know with certainty that we will only obtain  $E_1$  or  $E_2$  !!

To be specific, we will never obtain  $(E_1+E_2)/2$ , or any other value.

What about a and b?

 $|a|^2$  and  $|b|^2$  are the probabilities of obtaining  $E_1$  and  $E_2$ , respectively.

That's why we normalize the wave function to make  $|a|^2 + |b|^2 = 1$ .
